

“BUTTERED TOAST”

Is it really necessary to thoroughly butter your toast, that is, does the butter need to be evenly distributed on the surface of the toast for maximum satisfaction and enjoyment?

Or is there another way to get similar results?

I think there might be.

The alternative way is to strategically locate butter segments on the toast so that each bite has the potential to incorporate both butter and toast in satisfactory amounts of each.

Perhaps the first sensation after the bite is not one of total agreement of disparate flavors, but that inequity should quickly be remedied as both flavors unite to achieve perfect balance.

And this should no doubt happen before the food is swallowed.
